

Question 1 : Hex digits for a famous CPU found in Bill Gates' Revolution memory core dump.

Question 2: How many Micro Mote CPUs are packed in thimble?

Question 3: Bar Code Number on the SCSI Board of the WoW Blade

World of Warcraft server blade, 2007
Each realm of *World of Warcraft* is hosted on a discrete server, typically serving players in one geographical region. This is a blade from Ahygos, a server in use from January 4, 2007, through July 21, 2010, for players on the East Coast of the United States.
Acquired from the collection of Mike Brennan, 10274161

Q4: The IBM duplicating punch card machine is featured to be in the middle of processing a job for which Client?

Q5: First four digit on the bar code of the album featured in making music with computers. Do no use Google to look up the bar code.

Q6: The name of the “Robo Cop” found in the Museum

Q7: The age of the famous first female coder as feature in a photo of her in the Museum

Q8: The cost of a magazine during the age of the Mini Computers (i.e. how many cents?)

Q9: The Op Code for Branch and Link (BAL) for the famous OS from *The Mythical Man-Month*.

Transformer Read Only Store (TROS), System/360 Model 90, IBM, US, 1964
TROS held microcode in Model 90s. Microcode could be easily changed by swapping
one punched card for another with a different hole pattern. That allowed a Model 90
to emulate differently configured IBM 1401 computers—important for customers
considering upgrading from a 1401.

IBM System/360 and System/370 Reference Cards, IBM, US, 1960-1970s

Technicians and operators carried cards with the many reference manuals for each computer announced that you were an assembly
Gift of John Land, 102678081

Card from a Card-Capacitor Read-Only Store (CCROS), System/360 Model 30, IBM, US, ca. 1965
CCROS held microcode in Model 30s. Microcode could be easily changed by swapping one punched card for another with a different hole pattern. That allowed a Model 30 to emulate differently configured IBM 1401 computers—important for customers considering upgrading from a 1401.

IBM System/360 Principles of Operation, 1st edition, IBM, US, 1964

Principles of Operation detailed the structure, characteristics, and use of the System/360 line. It became a classic for its separation of "action" (design of the computer) from the implementation details of any particular machine.

Fred

Q10: Last name of inventor behind the “Human Intellect Augmentation” (*hint*: not related to machine learning. Upper case letters only)

Disk from Microcosm hypertext software, UK, 1994

Microcosm, like competitor OWL Guide, was a full-featured but standalone hypertext system which had some commercial success. Microcosm was developed by University of Southampton, UK, researcher Wendy Hall, a leader in the hypertext and later Web communities.

Douglas Engelbart

Englebart's goal was to make computers into tools that would augment human intelligence for solving universal problems. His lab pioneered the mouse, multiple windows, and more.

Theodor Holm ("Ted") Nelson

From 1959, Nelson conceived hypertext as a revolutionary new multimedia publishing system. His Xanadu concept influenced key computing pioneers.
